

Theory Engineer...

The link between salmonella bacterium & cancer(& Pneumonia) & how to solve the cancer problem & how I went from theory to engineering solutions...by Sari Grove

How I got to where I got:

I knew that the raccoon that I tried to rescue had eaten spoiled raw meat...

I knew that I had contracted some sort of bacterium...

I knew that raw meat when it spoils attracts salmonella typhi infection bacterium...

I knew a Cancerous lump was made of Calcium Phosphorus & a benign lump was calcium Oxalate...

So I knew the differential between benign & malignant was the Phosphate, the Phosphorus...

I was able to see pictures close-up of a calcium Phosphate breast lump...

I was able to see close-up what Phosphate/Phosphorus looks like...

On a hunch, I went to see what Salmonella looks like close-up, guessing that if the raccoon, & then I, had both gotten Salmonella, that my new breast cancer lump was somehow related to salmonella bacterium...

I was able to see a picture of the salmonella bacterium close-up...

Simply put, the picture of the Phosphorus in the Calcium Phosphate Cancerous lump, & the picture close-up of the Salmonella bacterium looked alike...

As an artist I am skilled at seeing things, similarities & differences...

Again...If you just look at the Phosphorus component of a cancerous lump, it looks like purple ants in the picture...In fact, better pictures show the ants truer in colour as a turquoise colour...Phosphorus as a rock mineral is turquoise...

Take a look at a salmonella bacterium up close...Turquoise ants...Same shape as the weird dark spots in your lump...

It even shows up when you take your own Macro photograph of your own lump using the DIY Mammogram editing tips I outlined in "Grove Health Science Series: Book 4" (about \$15 dollars right now on Amazon as a paperback)...

So that is how I made the correlation between a breast cancer lump & the salmonella bacterium...

Also:I know Copper antagonizes Phosphorus...I know licorice root is a copper...So taking licorice root tincture should eradicate the Phosphorus/Salmonella from my breast lump in pictures...& it did...

Once you eradicate Phosphorus from a breast lump it is no longer a Calcium Phosphate lump...It is now just a benign lump made of Calcium Oxalate, Oxalate means iron...

Manganese dissolves Iron...Take Manganese pills

(easy to get are 25 mg pills & I take just way more than the recommended dosage to get an effect-maximum maybe off label dosage to dissolve lump might be 10 pills x 3 times a day, stop if you feel vomity),

to dissolve the iron nature of the lump...

Iodine dissolves Calcium...A good herbal plant called Madagascar Periwinkle can be boiled & drunk as a tea & that tea contains Vinpocetine which is a highly absorbable form of Iodine...

(You can also buy Vinpocetine pills for more money & not necessarily better results)...

(Madagascar Periwinkle is also called Vinca Minor)...

Eat a raw vegetable diet...

Cheat with fish or seafood because they are high in Iodine...

Walk 10 kilometers a day(6 miles)...Cheat by sleeping some days when you are tired...

Bread, breaded coatings, cereals, crusts, grains, glutes, can make the lump larger & block up your digestive system, cause bloating, & generally slow down your nonsurgical breast lump removal program...

Sugar doesn't help either...

Artificial sweeteners like Stevia or Splenda contain one sugar molecule & 4 potassium molecules...Potassium actually lowers blood pressure so these are fine...The one sugar/sulphur molecule shouldn't worry you...So these are all fine...(though if you have Low blood pressure be careful with art. sweeteners-they will lower it more)...

Water & Alcohol contain Hydrogen...Hydrogen makes lumps bigger...So cancel that 8 glasses of water a day idea when trying to shrink a lump...Water makes lumps bigger actually...Same goes for alcohol...

(Now alcohols can contain other things which may be good for shrinking a breast lump & if you are thirsty water is good for you there...But this whole drink lots of water thing is not correct when you are trying to shrink a lump...Water is a food...Think of it that way...)

If you are fasting, but drinking liquids, liquids act as your food...In those cases you do need to drink because you are not getting any other nutrition...

If you are a salt eater you can carry 15 lbs of water in your system from just water retention caused by the salt...This will make your lump bigger...Cut out salt...This will help you to lose that water weight...
